"Long-Term Results of Tooth Replantation"

Moscow, Stomatologiya, No 1, 1972, pp 27-29

Abstract: Five-year follow-up of 53 persons who had one tooth each replanted showed that only 28 teeth had survived. Twenty-five had to be removed during the first 3 years because of inflammation, suppuration, or marked resorption of the roots. Fifteen of the surviving teeth exhibited pathology of the periodontium and surrounding tissues (gingival fistula, chronic infiltration of the mucosa, root resorption, looseness of the tooth). Thirteen were in good condition and served mostly as supports for bridges. Thus, replantation of teeth is not a satisfactory method of treating periodontitis. The operation should be reserved only for cases where conservative treatment has been ineffectual and where tooth preservation is dictated by the peculiar condition of the jaws.

PROCESS OF RESORPTION IN REPLANTATION OF TEETH

Summary. The article contains clinico-roentgenological observations over some features specific to the development and localization of the process of resorption of the root in replantation of the tooth. The resorption process is characterized by that the destruction of the dental root occurs mainly in the pericervical portion, embracing circularly this region of the root, as if detaching the drown from the root. The remaining part of the root retains its normal relation with the periodontium and alveolus.

"Concerning the Mechanism of Failure of Gunn Diodes"

Leningrad, Fizika i Tekhnika Poluprovodnikov, Vol 6, No 9, Sep 72, pp 1670-

Abstract: Devices based on the Gunn effect operate most effectively at high bias voltages; however, increasing the voltage causes breakdown of the device. At present there is no unanimous opinion on the mechanism of failure and degradation of Gunn diodes. In this paper the authors investigate coplanar Gunn diodes with plane-parallel and annular electrode configurations both with and without a silicon dioxide passivating coating. The diodes were tested in the pulse mode. It is shown that in accordance with previously available experimental data the failure of Gunn diodes takes place as a result of formation of a shorting channel between the contacts of the device. Information is obtained on the dynamics of the visible portion of the breakdown by means of motion picture photography of this process through an optical microscope. It is shown that silicon dioxide passivation of the

USSR

CHIGOGIDZE, Z. N. et al., Fizika i Tekhnika Poluprovodnikov, Vol 6, No 9, Sep 72, pp 1670-1676

active region has an appreciable effect on the nature of the visible portion of the breakdown and on the ratio of the breakdown voltage to the threshold voltage. A microscopic x-ray analysis is made of the composition of the contact regions and the channel on various stages of thermal breakdown. It is found that a transverse magnetic field affects the position of the shorting channels and the ratio of the breakdown voltage to the shorting voltage. A study is made of Gunn diode emission in the infrared region of the spectrum at voltages close to the breakdown voltage. It is concluded that the cause of failure of Gunn oscillators at high bias voltages is the formation of current strings caused by the development of an S-shaped current-voltage curve due to impact ionization when a strong field domain passes over the specimen. The authors thank M. S. Shur for discussing the results of the paper, and N. N. Mamatsashvili for taking part in the measurements.

"Non-Destructive Testing of a Weld in Continuous Chemical Cleaning"

Moscow, Metallurg, No 9, Sep 71, pp 28-29

Abstract: A new method of non-destructive testing of weld joints in chemical cleaning, based on pressing in a purch into a weld with simultaneous application of dynamic loads, is described. Tests were conducted on a special stand. The results show that such testing makes it possible to roll strips with welded joints without decreasing the rolling rate. The hourly productivity of the mill is increased significantly and the quality of the finished sheet is improved. Refuse decreases, due to process stabilization. The method described can also be used in investigating the separation of metal into layers.

"A Converter Which Changes a Time Interval, Frequency and Frequency Ratio to Digital Code"

Moscow, Otkrytiya, Izobreteniya, Promyshlennyye Obraztsy, Tovarnyye Znaki, No 10, Apr 72, Author's Certificate No 332571, Division H, G, filed 24 Oct 68, published 14 Mar 72, p 224

Translation: This Author's Certificate introduces a converter which changes a time interval, frequency and frequency ratio to digital code with correction of the result of conversion. The invention is based on Author's Certificate No 227722 with the distinguishing feature of simplification by using two coincidence circuits with some of their inputs connected to the circuit for the initial setting of the main counter, while the other inputs are connected to the outputs of the flip-flops in the auxiliary counter. The outputs of the coincidence circuits are connected to the circuits for the initial setting of the auxiliary counter.

"Integrated Circuit Voltage-to-Frequency Converter"

Moscow, Pribory i sistemy upravleniya, No 6, 1972, pp 27-29

Abstract: The description is given of a voltage-to-frequency converter, developed in the form of an integrated circuit for use in a complex of frequency-digital control instruments for general industrial use. Its design is basically one of balanced conversion with pulsed feedback, a principle which is now recognized as extion speed and low conversion error. The basic components of the converter circuit are integrated circuits of the 101, 122, and 140 charge of a capacitor in an integrating circuit by a current prostable quantity of electricity. The block diagram and schematic of the instrument are given together with a mathematical analysis explained.

"Syntheses in the Purine Series. XXXIV. Conversion of N,N'-Dimethylxanthines in the Reaction with Phosphorus Oxychloride in Presence of Tertiary Amines"

Moscow, Khimiko-Farmatsevticheskiy Zhurnal, Vol 7, No 5, May 73, pp 27-29

Abstract: Theobromine, in the presence of N,N-dimethylaniline (DMA is converted to 2,6-dichloro-7-methylpurine (I) in 25% yield. When phosphorus pentachloride is used instead of DMA, the yield is almost quantitative. Theobromine reacts with POCl, in the presence of DMA to yield (I) and a bright red para-condensation product of DMA and a molecule of purine; the structure of this addition product was confirmed by PMR analysis. To avoid this side reaction, it is recommended to use triethylanine hydrochloride instead of DMA hydrochloride.

"Cold-Resistant Nickel-Free Structural Steel"

Dnepropetrovsk, Metallurgicheskaya i Gornorudnaya Promyshlennost', No 6, Nov-Dec 70, p 34

Abstract: A new procedure for producing cold-resistant nickel-and molybdenum-free steel developed jointly by members of the Don Scientific Research Institute of Ferrous Metallurgy and the Novokramatorsk Machine Building Plant is described. The chemical composition of this steel is (%): 0.35 C, 0.33 Si, 1.16 Mn, 0.29 W, 0.017 Ti, 0.021 Al, 0.034 S, and 0.023% P. Mechanical properties were determined after tempering at 880° and annealing at 600 and 650° on 28 x 28-mm longitudinal samples cut into bars. The sensitivity to overheating was determined by the drop in impact strength. The test results show that the steel is insensitive to overheating, possesses a significant reserve of viscosity (22-29 kg/cm² at -70°C), and its cold brittleness threshold, defined as the temperature at which 50% of the viscosity is lost, compared with viscosity at room temperature, lies below -70°C. 1/1

"Syntheses in the Purine Series. Report 28. The Role of Phosphorus Pentachloride in the Transformation Reaction of Theobromine or 8-Chlorotheobromine

Moscow, Khimiko-farmatsevticheskiy Zhurnal, Vol 5, No 12, Dec 71, pp 17-20

Abstract: This study concerns the transformations of adducts (I, II) which were formed in the reaction of theobromine (III) or 8-chlorotheobromine (IV) with phosphorus oxychloride when treated with phosphorus pentachloride. It is noteworthy that 2,8-dichlotheobromine (V) is capable of addition of not only phosphorus oxychloride or phosphorus pentachloride to form adducts II or a new adduct -- a,6,8-trichloro-3,7-limethyldihydropurine tetrachlorphosphate (VII) but also phosphorus pentachloride. In this case a new adduct is formed in which OSbCl4 (IX) is the anion. It reacts with alcohol and is transformed to the ethoxyderivative (X). The position of the ethoxygroup is confirmed by the formation of 6-ethoxy-8-chlorotheocromine as a result of hydrolysis. The basic transformational stages of III and IV to

Translation: This Author's Certificate introduces a miniature pushtation which which contains a housing, contacts, drive element and locking device. As a distinguishing feature of the patent, the switch is designed for sequential contact selection. Three coaxial discs are used in the switch, the central one being movable while the upper and lower discs are securely fastened to the housing. Beyond lugs are uniformly arranged around the edge of the lower surface of the movable disc and the upper surface of the bottom disc. The bevels assure rotation of the movable disc through a certain angle. The lower side of the upper disc is fitted with teeth uniformly arranged around the periphery. Fixed contacts are fastened to the lateral surfaces of each of these teeth. On the upper side of the movable disc are two diemetrically opposite teeth which rotate the movable disc, one of them acting as a movable contact.

"Mechanism of the Effect of Titanium on the Structure and Properties of Conversion Pig Iron Castings"

Moscow, Izvestiya Akademii Nauk SSSR, Metally, No 2, Mar-Apr 72, pp 139-143

Abstract: Titanium was added to molten iron at 1200 and 1300°C in the form of compact titanium (99.7% Ti) and grade TG-ChM) titanium sponge (96-98% Ti). The resulting pig iron, containing 0.5-0.8% Ti, was studied and compared with samples of the same iron without titanium. It was established that there is an ambiguous effect of both forms of titanium on the size and nature of the graphite plates in the castings. Compact titanium facilitates development of an interdendritic spot and fine-plate graphite. The addition of entry of a significant amount of hydrogen. The coagulation of graphite plates in the modified iron has been linked with the interaction of hydrogen with oxygen, adsorbed on submicroscopic graphite particles. This leads to removal of oxides from the surface layers, promotes segregation and achievement of critical sizes, and increases the rate of growth of the graphite

"Mature of Monmetallic Inclusions in Titanium-Modified Cast Iron"

i dan da karenda

Moscow, Izvestiya Vysshikh Uchebnykh Zavedeniy, Cherneya Metallurjiya, Il 5,

Abstract: Investigations were conducted of the nature of nonestablic inclusions in east from with various (from 0.05 to 0.75%) titanium cupplements to intermine the role of the latter in the conversion of the latter in the case of the latter in the conversion of the latter in the conversion of the case of the case from injects, remelted in an induction furnace from conversion cast from the case from injects, composition (%): 4.14 C, 0.67 Si, 0.42 Mm, 0.041 S, 0.074 F. If the let itemize (99.7% pure) was introduced into the molten cast from at a temperature of 14669C. Lytically-separated deposits and also by a local x-ray method directly on slides. Metallographic investigation of the experimental samples indicated that the addition of titanium caused a whole series of inclusions, the amount of which

USSR BRAYWIN, I.YE., etc., Izvestiya Vysshikh Uchebnykh Zavedeniy, Chernaya Metallurgiya, No 5, 1970, pp 141-143

increases with a rise in titanium content. The following empounds were detected: TiC, FeO TiO2, TiO2, TiO3h, TiMn2, TiO03, Ti (C, N); titanium mitrides in pure form were seldom encountered. The absence of contact of titanium compounds with graphite and enlargement of dimensions of the latter were established. This confirms the work of V.L. Gutorova, in which it was postulated that nonnetablic titanium inclusions are not graphitization centers. The increased resistance of large-mass ingot molds, cast from basic blast-furnace east iron modified with titanium sponge, is associated with the enlargement of graphite flakes and with the increase in the ferrite content in the metal base caused by the indirect action of titanium, (binding oxygen and nitrogen into stable compounds) and by the action of hydrogen, introduced by the titanium sponge.

"Study of the Deformed State and Rigidity of Bent Curved Tubes of Large Curvature"

Sb. tr. Leningr. inzh.-stroit. in-t (Collection of Works of Leningrad Structural Engineering Institute), 1971, No. 68, pp 35-42 (from RZh-Mekhanika, No 3, Mar 72, Abstract No 3V453)

Translation: The problem of the bending of a tube of large curvature is solved. The equations of the theory of shells expressed in displacements are solved by the small parameter method using the ratio  $r/\rho$  as the small parameter, where r is the radius of the cross section and  $\rho$  is the radius of the longitudinal axis of the tube, and the second approximation is considered. Equations of the second approximation are solved keeping nonlinear terms in the right sides determined by quadratures and the products of the functions and their derivatives found in the first approximation, which had not been considered previously. Deformations of the transverse cross section and the coefficient for the lowering of rigidity of tubes of different curvature and reduced length are calculated in the first and second approximations. The limits of application of the approximate the deformation state and the coefficient for the drop in rigidity of curved tubes are established. V. I. Baulin.

"Investigation of Heating Steel NN3B (OKh18N5G12AB) Ingots"

Moscow, Kuznechno-Shtampovochnoye Proizvoistvo, No 10, Oct 73, pp 39-40

Abstract: Steel MN3B can be greatly strengthened at 550-800° C and forged at 950-1250° C, but its deformability at higher temperatures is sharply diminished, and tests were conducted to determine the soak times and temperatures and heating rates to produce the highest forging temperature and best metal structure. Tests were made by heating at an arbitrary rate, soaking for a period, heating to a higher temperature at an arbitrary rate and soaking. The short coming of this method was that temperatures measured were furnace temperatures and not ingot temperature. Therefore, holes were drilled in test ingots for placement of thermocouples. Tests showed that at low furnace temperatures (650° C), the differences in furnace and ingot temperatures is high (200-350° C over a 7-hour period). At a furnace temperature of 1250° C this difference is only 60-80° C. When the temperature of the furnace was increased from 650-900° C the ingot temperature rise was such faster than at 050° C. Tests were also conducted for the fastest possible heating rates (400-500° C/hr) which showed that during

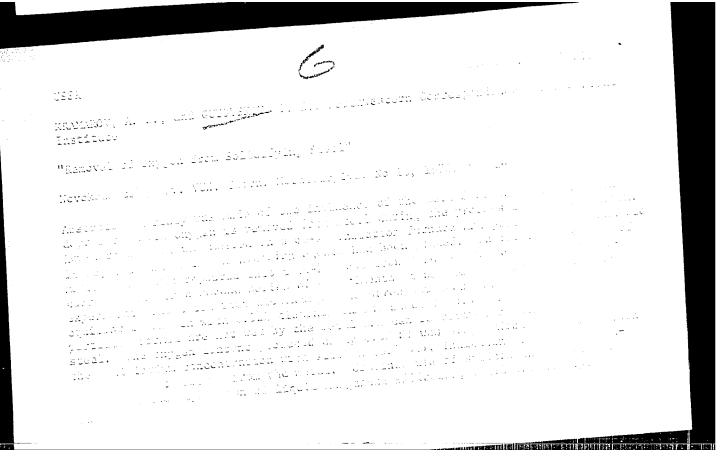

USSR

BRUK, YU. G., et al., Kuznechno-Shtampovochnoye Proizvodstvo, No 10, Oc 73, pp 39-40

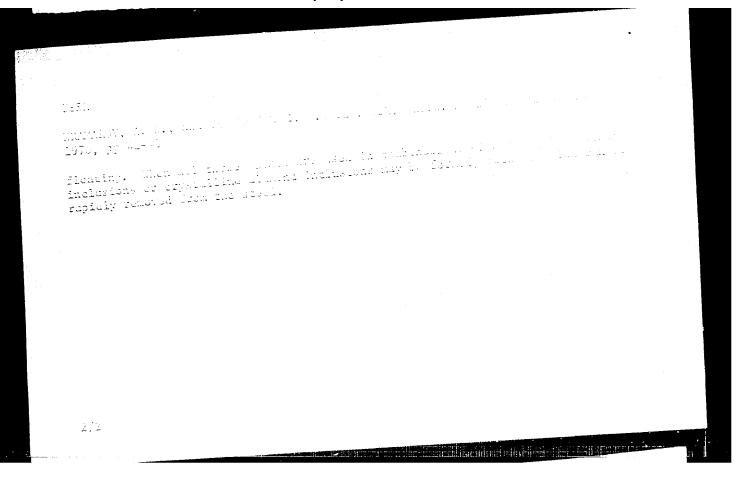

certain heating periods the temperature drop along ingot length was 650°C, which promoted development of numerous internal defects. The final conclusions for the heating of steel NNJB were to soak ingots at 650°C for 4.5 hours, 900°C for eight hours with final heating to a furnace temperature of 1300°C (ingot temperatures -- 1220-1240°C). This procedure increased the number of forging operations per heating, reduced the number of heatings, and reduced the number of cracks and scrap ingots by four times. Three figures, one bibliographic reference.

"Theory of Analysis and Synthesis of Alloys and Materials Inhomogeneous As to Physical Properties"

Moscow, Doklady Akademii Nauk SSSR, Vol 203, No 6, 1972, pp 1286-1289

Abstract: The article singles out a class of inhomogeneous objects with physical properties which are linearly described by parameter-dependent specific physical quantities of individual homogeneous parts of an object, and suggests a theory for their analysis and synthesis which is common to all. these objects. Examples of objects of this class can be multilayer, particularly thermomagnetic materials, certain powdered materials and multiphase alloys. The purpose of the article reduces to finding methods for the exact and approximate determination of the relative content of homogeneous parts of an object from its experimentally determined or given averaged property values. The procedure is based on the discrete representation of the quantities

under consideration and their vector description. The results can be used for the analysis and synthesis of inhomogeneous materials and alloys, particularly for thermal physicochemical analysis and kinetic-study data analysis, for the synthesis of multilayer and powdered materials.

The author thanks V. T. BORISOV for a critical discussion of the work and useful comments.

"A Device for Determining the Magnetization Curve and Hysteresis Loops of Magnetic Materials"

Moscow, Otkrytiya, Izobreteniya, Fromyshlennyye Obraztsy, Tovarnyye Znaki, No 7, Mar 72, Author's Certificate No 329486, Division G, filed 8 Apr 68, published 9 Feb 72, p 182

Translation: This Author's Certificate introduces a device for determining the magnetization curve and hysteresis loops of magnetic materials. The device contains a measurement and a magnetizing coil for the specimen to be studied, a fluxmeter (in the form of an integrating amplifier), an adder, an integrating amplifier for the ragnetization circuit, a power amplifier, a calibrated resistor, and a registration instrument. As a distinguishing feature of the patent, the device is designed for increased precision and speed, and for automation and programming of the measurement process. For this purpose it is equipped with a program input controller of the change in magnetic flux in the form of a time-variable voltage controller. The

- 124 -

USSR

GUTOVSKIY, I. G. et al., USSR Author's Certificate No 329486

device also includes a switch. One input of the adder is connected to the voltage controller, and the other adder input is connected to the output of the magnetic fluxmeter. The output of the adder is connected to the integrating amplifier of the magnetization circuit through the switch. The controlling input of the switch is connected to the output of the adder and to the controlling input of the voltage controller through a logic circuit of the "exclusive OR" or "equivalence" type.

"Laboratory Thermostat for the 68-670° K Range. Methods of Measurement and Stabilization of Temperature"

Vopr. Elektrodinamiki i Teorii Tsepey. Vyp. 6 [Problems of Electrodynamics and the Theory of Circuits. 6th Edition -- Collection of Works], Riga, 1972, pp 103-112 (Translated from Referativnyy Zhurnal Metrologiya i Izmeritel'naya Tekhnika, No 3, 1973, Abstract No 3.32.840), by V. S. K.

Translation: Structural diagrams are presented for thermostat for temperatures below -196° C; from +10° to -196° C; from +30 to +400° C, as well as structural diagrams of their parts (evaporator voltage regulator, manostat). A platinum resistance thermometer made in the form of a spiral placed in a capillary of Pyrex glass is used to measure temperatures from -196° C to +400° C. The thermal inertial of the thermometer is not over 0.5-0.8 s. The calibration of the thermometer after aging is based on the melting point of ice and the boiling point of water. The temperature measurement error is not over  $\pm 0.02^{\circ}$  C. Stabilization of temperature in the -180° C to +10° C interval is achieved by positional regulation and depends on the intensity of the flow of liquid nitrogen vapor, determined by the power dissipated by the evaporator in a standard metal Dewar vessel. Temperatures 1/2

"Investigation of the Magnetic Spectra of Ferrites Over a Wide Range of Frequencies and Temperatures"

Dokl. Vses. nauchno-tekhn. konferentsii po radiotekhn. izmerenivam. T. 1 (Reports of the All-Union Scientific and Technical Conference on Radio Engineering Measurements. Vol. 1), Novosibirsk, 1970, pp 153-154 (from RZh-Radiotekhnika, No 1, Jan 71, Abstract No 1A365)

Translation: A procedure and installation are developed for taking the magnetic spectra of ferrites in the frequency range from 0.1 to 10,000 MHz and at temperatures from -200 to +400°C. Measurements were made on toroidal specimens for 50 Ω coaxial line. A system is described for maintaining temperature with a precision of ±0.5°C. On frequencies above 50 MHz, permeability was measured with respect to the input impedance of a short—circuited section of coaxial line, while a Q-meter was used on frequencies below 50 MHz. It was found that the behavior of the spectrum for nickel—zinc ferrites changes at temperatures below -100°C: the dispersion spectrum changes to a triple dispersion spectrum. E. L.

"Absorption of Gases by Niobium Materials in the Stream of an Argon Plasma"

Metallovedeniye[Metal Science -- Collection of Works], No. 14, Leningrad, Sudostroyeniye Press, 1970, pp. 227-232. (Translated from Referativnyy Zhurnal Metallurgiya, No. 5, 1971, Abstract No. 5 1738 by the authors).

Translation: The influence of temperature, holding time, and content of impurities of active gases in the stream of an argon plasma on the corrosion resistance of Nb alloys is studied. It is established that in the stream of an argon plasma, intensive interaction of the metal with the active gases present in the Ar occurs. The composition of the reaction products formed on the surface of the metal as a result of its interaction with gases at 1300 and 1500° is determined. 4 figs; 2 tables; 7 biblio refs.

"Results of a Study of the Combustion and Temperature Regime of the Lower Radiation Section of the TGMP-114 Boiler"

Moscow, Teploenergetika, No 3, 1973, pp 43-46

Abstract: Earlier gas-mazut boilers of this general type were not completely satisfactory on account of the low reliability of the heating surfaces (mainly the lower radiation section) and the great heat flow in the combustion chamber.

This difficulty has been corrected in the new main-series supercritical pressure TGMP-114 boiler by reducing the number of boilers (from 8 to 6), securing maximal removal of the extreme burners from the side walls, and use of recirculation of cold smoke gases into the lower part of the furnace

The direct-flow TGMP-114 boiler has an output of 950 t/hr, with steam parameters of 255 kg/cm<sup>2</sup> and 565/570°C. Analysis of operational data on chemical control

shows that in 1971 iron content of feed water was 10-15  $\mu/kg$ , 15-20  $\mu/kg$  the previous year, and 20-50  $\mu/kg$  during the start-up period in 1969, with high content of 100-150  $\mu/kg$  in individual cases. These facts point up the formation of iron oxide deposits as a basic cause of the external corrosion of the screening pipes of the lower radiation section, and emphasize the necessity of water control and chemical cleansing.

"A Subgenus of Bloodsucking Mosquitoes of the Genus Aedes New for the USSR Fauna - Neomelaniconion Newst. (Banksinella Theob.) (Diptera, Culicidae)"

Leningrad, Entomologicheskoye Obozreniye, No 1, 1973, pp 176-177

Abstract: Contrary to the author's initial assumption that the new mosquito species Aedes aureus Cuts. found in 1955 in the Maritime Territory belongs to the subgenus Aedes, he now assigns it to the subgenus Neomelaniconion Newstead, 1907, because of numerous morphological similarities to the only Neomelaniconion species known in Asia - Aedes lineatopennis. Among the substantial differences between A. aureus and mosquitoes of the subgenus Aedes are the narrow scales in the center of the occiput and fairly long palpi of the females (mostly wide and very short, respectively, in the subgenus Aedes).

Leningrad, Entomologicheskoye Obozreniye, Vol 51, No 2, 1971, pp 401-402

Abstract: Studies were carried out on A. albescens Edw. to determine whether or not it is a species distinct from A. lepidonotus Edw. rather than a synonym, and to ascertain its position with respect to A. subdiversus Mart. Collections at the Zoological Institute and Omsk City Epidemiological station included no A. lepidonotus, which is a Mediterranean mosquito easily identified by presence of scales on the postscutellum, lacking in the other 2 species. Female A. albescens and A. subdiversus were found to be morphologicall different, but differences in males and larvae remain undetermined. Though these 2 species are sympatric. A. subdiversus is found further west (to the Volga), east (to the Transvaika), and south (to sourthern Kazakh SSR regions).

"Digital Comparator Voltmeters"

Moscow, Pribory i Sistemy Upravleniya, No 1, Jan 72, pp 48-49

Abstract: The article describes the F485 and F 486 digital AC voltmeters which operate on the principle of nonsimultaneous comparison of inhomogeneous voltages. The instruments were developed by the cooperative efforts of the Institute of Automation and Electrometry of the Siberian Department of the Academy of Sciences of the USSR and the Special Design Office at the L'vov Electrical Measuring Instrument Plant. A block diagram of the instruments is given, and the operating principle is described. The measurement error in the frequency range from 45 Hz to 20 kHz is no greater than  $\pm (0.1 + 0.1 V_{\rm X}/V_{\rm f})$ % for the F485, and  $\pm (0.3 + 0.2 V_{\rm X}/V_{\rm f})$ % for the F486, where  $V_{\rm X}$  is the instantaneous value of the measured voltage, and  $V_{\rm f}$  is the

"Derivatives of Lepidinium as Regulators of the Growth and Development of Plants. V. Effect of (1-phenylquinoline-4)-n-dimethylaminostyrylchloride on Certain Beans"

Fiziol. aktivn. veshchestva. Resp. mezhved. sb. (Physiologically Active Substances. Republic Interdepartmental Collection), 1972, No 4, pp 105-108 (from RZh-Khimiya, No 2 (II), Feb 73, Abstract No 2N539)

Translation: Data are presented from a study of the effect of the preplant treatment of bean seed with a solution of (1-phenyl-quinoline-4)-n-dimethyl-aminostyrylchloride (I) on the physiological-biochemical processes and the harvest yield of the plants. As a result of treating the seed with a  $10^{-6}$  molar solution of I there was a 12% increase in chlorophyl (a + b) content in the leaves of the plant in the flowering phase, the dry matter content increased by 1%, and the increase in yield was 8-14%.

#### Bionics

USSR

GUTSU, I. P., Candidate of Biological Sciences

"Bionics Seeks Reserves"

Kishinev, Sovetskaya Moldaviya, 28 Oct 72, p 4

Translation: From ancient times living nature with its amazing creations has been the object of the fixed attention of thinkers and scientists. But whereas in ancient times humans used the laws of nature in their practical activity in a spontaneous, natural way, and subsequently found by accident many analogies between the processes and designs of living nature and the creations of human hands and minds, today these laws and analogies are becoming the object of research and conscious use. To be more precise, they are "within the sphere" of bionics, one of the youngest and most promising sciences.

In a talk with our correspondent, candidate of biological sciences Ivan Petrovich Gutsu tells of trends in its development and the utilization of its recommendations and conclusions in practical activity.

Question: The slogan of bionics is "Living prototypes are the key to new technology." Does this mean that the final goal of bionics is just the creation of engineering systems?

1/6

APPROVED FOR RELEASE: 08/09/2001 CIA-RDP86-00513R002201110004-0"

USSR

GUTSU, I. P., Sovetskaya Holdaviya, 28 Oct 72, p 4

Answer: Bionics is engaged in the purposeful study of the principles of construction and functioning of biological systems and their elements in order that the knowledge obtained may be used for fundamentally improving existing machines, instruments, equipment, construction designs, and industrial processes and creating fundamentally new ones. So the sphere of interests of bionics involves, above all, the study of those biological processes and mechanisms which, on the basis of their design and functional parameters, can be used to solve concrete problems of the national economy, health, and so on. However, the subject matter of bionics is much broader. It includes the widespread application of principles, mechanisms, and concrete designs tested by nature in various types of practical human activity. The birth of bionics was dictated by the natural process of dialectical development of modern science and technology, and it reflects the everincreasing tendency of science and practical work to draw closer.

Question: Few are surprised any more by the fact that technical systems created by human hands and minds and natural biological design sometimes possess strikingly profound structural and functional similarities. But after all, not everything in nature is ideal.

2/6

<del>- (, -</del>

APPROVED FOR RELEASE: 08/09/2001 CIA-RDP86-00513R002201110004-0"

USSR GUTSU, I. P., Sovetskaya Moldaviya, 28 Oct 72, p 4

Answer: True. Therefore, what bionics teaches is precisely rational copying of living nature, searching for technical methods, means and conditions for using knowledge about biological objects and processes purposefully, not blindly copying nature down to the smallest details. The bionics method of rationally copying nature is usually combined with the creativity of scientists and frequently a number of characteristics not possessed by the living organism are added to the model. The investigator of biological objects and processes, the bionics specialist, is interested, above all, in data which make it possible for him to draw a conclusion on the expediency of using biological mechanisms, principles, and adaptations which do not yet exist in manmade form.

Here are some concrete examples. Means of navigation are well known. But the existing systems are cumbersome and expensive. At the same time, biologists know a large number of living organisms which possess marvelous systems for orientation and navigation. They are significantly better than those we have in engineering. Sea turtles, for example, swim several thousand kilometers to sea, but they return to the very same spot to lay their thousand kilometers to sea, but they are stars in the sky for long-distance eggs. It is assumed that they use the stars in the sky for long-distance orientation, while for short-range orientation they use the smell of coastal waters. It would be useful for engineering to figure out the astounding 3/6

USSR

GUTSU, I. P., Sovetskaya Moldaviya, 28 Oct 72, p 4

capabilities of pigeons. Scientists' first experiments lead us to the thought that pigeons have sensitivity to the earth's magnetic field, although orientation by stars is not impossible. And wouldn't it be interesting to discover how the swordfish is able to develop speeds of up to 130 kilometers an hour in the water, or to learn the secret of the endurance of the stormy petrels, who travel 10,000 kilometers without stopping?

Or look at the following stunning comparison. The ratio of weight to engine power in horsepower for the IL-18 and TU-114 airplanes is 14, while for the eagle the coefficient is 70 and for the stork it is 135. And here is another example. Whereas for our construction designs the ratio of height to the greatest diameter does not exceed 250-300 (wheat). The static and dynamic loads on the wheat in this case, as for other plants, are concentrated at the upper end of the structures. There is no doubt that an analysis of similar natural construction will be very useful in practice. It will help engineers find improved construction designs and architectural forms and will suggest a number of interesting concepts for optimal distribution of leads and technology for manufacturing universal construction materials.

Question: All that is unquestionably very interesting. But are there precedents for such borrowing in current-day practice?

4/6

USSR

GUTSU, I. P., Sovetskaya Moldaviya, 28 Oct 72, p 4

Answer: Of course there are. Measuring technique, for example, has received quite a few. An instrument which has received the name gyrotron was created by analogy with the organ of certain insects which reacts to angular deflection. On the basis of certain principles of the construction and functioning of the insect eye, a ground speed measuring device for airplanes and other aircraft has been created. An instrument which forecasts the approach of a storm 15 hours before it arrives has been designed on the basis of the operating principle of certain organs of the jellyfish.

A new surfacing which sharply reduces water resistance when ships move has been created on the model of dolphin skin. Very reliable and convenient-to-use self-sharpening cutting tools for turning lathes have been developed on the model of rodent teeth. An analysis of the ways that penguins move across snow made it possible for Soviet scientist A. Nikolayev to construct a new type of all-terrain vehicle for the polar regions of the country, and it develops speeds up to 50 kilometers an hour. All this is just a small part of what science and engineering have already borrowed from living nature.

Question: And now, please, a few words about nature's "Patients", the substance of which it has not yet been possible to reveal. In other works, what are the prospects of bionics... 5/6

USSR

GUTSU, I. P., Sovetskaya Moldaviya, 28 Oct 72, p 4

Answer: Among them we may include searching for biological ways to extract useful minerals, processing wood tissue into proteins and fats (and by the way, termites have this property), and the problem of fresh water. Bionics has an enormous part in the development of medicine, in comprehending one of the greatest riddles of nature, the secret of the human brain....

Academician Kedrov once remarked that our time will probably by marked not so much as the century of the atom, cybernetics, and space sciences, as the age of biology and bionics. One cannot disagree with this, bearing in mind the principal problem of the young science, seeking reserves and possimind the principal problem of the young science, seeking reserves and possibilities whome use will make it possible to increase production efficiency, labor productivity, and public welfare even more.

The practical achievements of bionics may still be fairly modest, but the prospects are enormous. By borrowing reserves from nature and making them material, bionic scientists are making a substantial contribution to development of our country's national economy and to the progress of our society.

"Derivatives of Lepidinium as Plant Growth and Development Regulators. IV. Synthesis and Physiological Activity of Some Derivatives of 1-methyl-6-oxylepidinium Chloride"

Fiziol. aktivn. veshchestva. Resp. mezhved. sb. (Physiologically Active Materials. Republic Interdepartmental Collection), 1972, No 4, pp 101-105 (from RZh-Khimiya, No 5 (II), 1973, Abstract No 5N641)

Translation: A method was developed for obtaining compounds with the formula (I): 137.6 grams of p-MeNHC<sub>6</sub>H<sub>4</sub>OH, 240 ml of acetone, 4.9 ml of concentrated HCl (acid) and 100 ml of water were heated at 80°, and a mixture of 12 grams of paraform, 40 ml of BuOH, 1 ml of concentrated HCl (acid) and 60 ml of acetone was added with mixing. The reaction mass was heated for 4 hours and left to stand for 24 hours. The acetone was driven off, 120 ml of alcohol

BUTNITSKIY, I. N., et al., Fiziol. aktivn. veshchestva. Resp. mezhved. sb., 1972, No 4, pp 101-105

was added, the mass was cooled and the I (R = H, Y = H<sub>2</sub>, X = Cl) (Ia) was isolated with a melting point of 185° and a 50% yield. On replacing the HCl (acid) with 57% HClO<sub>4</sub>, I (R = H, Y = H<sub>2</sub>, X = ClO<sub>4</sub>) was obtained with a melting point of 195-197°. The reaction of Ia with the corresponding aromatic aldehydes in the presence of pyridine yields I (R, Y, X are presented, melting point in °C): H, CHPh, Cl 233-235; H, CHC<sub>6</sub>H<sub>4</sub>NO<sub>2</sub>- $\pi$ , Cl, 217; H, CHC<sub>6</sub>H<sub>4</sub>NO<sub>2</sub>- $\pi$  Cl, 223-224; H, CHC<sub>6</sub>H<sub>4</sub>OH- $\pi$ , Cl, 223-225; H, CHC<sub>6</sub>H<sub>3</sub>OH- $\pi$ -OMe- $\pi$ , Cl (Ib), 228-229; H, CHC<sub>6</sub>H<sub>4</sub>NMe<sub>2</sub>- $\pi$ , Cl (Ic), 207-209. On solution in an acetic anhydride medium, I (R = Ac, Y = CHC<sub>6</sub>H<sub>4</sub>NMe<sub>2</sub>- $\pi$ , X = Cl) is obtained with a melting point of 74-5°. Also 1-methyl-6-oxyquinoline-4-(1'-ethylquinoline-4')-monomethinecyaniniodide is obtained with a melting point of 205-207°. The growth stimulating activity of Ib and Ic in the initial growth phase of Belotserkovskaya 23 wheat and Nadezhnyy oats with a 0.0001 M concentration of the solutions is equal to the activity of K heteroauxinate. For Part III see RZh-Khimiya, 1971, Abstract No 18N683.

"Calculation Of The Characteristics Of A Magnetron By A Study Of Electron Conduction"

Tr. Mosk. energ. in-ta (Works Of Moscow Power Institute), 1972, Issue 90, pp 140-146 (from RZh: Elektronika i yeye primeneniye, No 8, August 1972, Abstract No 8A97)

Translation: The paper sets forth a method of calculation of the active and reactive components of the electron conduction of a multicavity magnetron. The method is based on a determination of an induced current with the sid of a specific model of an electron spoke convergent from the hub of the space charge to the anode. The boundaries of the spoke are determined by the relations between the intensities of the synchronous, static, and high-frequency fields. The calculated amplitude characteristics of the electron conduction are presented for various values of the anode voltages and magnetic inductions. The active electron conduction has a nonmonotonic dependence on the amplitude of the high-frequency voltage Ut with an ascending initial segment. The characteristics of the electron conduction are used to determine the power and frequency of generation at points of steady-state oscillations, with various values of the exterior Q of the resonator system. The conditions are determined for the disruption of 1/2

GUTTSAYT, E.M. Tr. Mosk. energ. in-ta, 1972, Issue 90, pp 140-146

generation and the change of the boundaries of the generation zone as a function of the high-frequency load. An expression is also obtained for the anode current as a function of the magnitude U<sub>t</sub>, and the current-voltage characteristics are calculated. Curves are presented of the electron displacement of a frequency passing through the maximum (as this is observed experimentally). Besides that, on the basis of the characteristics of the electron conduction presented, the amplitude characteristics are calculated and plotted of a regenerative magnetron amplifier with an inserted load exceeding the limiting value. The magnitude is determined of the threshold power of the input signal. All calculated characteristics are found in good accordance with experimental results published earlier. 7 ref. E.G.

SO: JPRS 54356

UDC 612.017.2:612.014.47:531.113 16 ABN 20

Abstract: The effect of habituation to one of three tests (including Coriolis and linear accelerations) on tolerance to the other two was studied. The experiments revealed a nonspecific increase in tolerance to those tests to which no adjustment was acquired. adjustment was acquired.

The attention of specialists engaged in vestibular apparatus adaptration has always been directed to selective adaptration to a vestibular stimulus (k. khilov; A. I. Yarotskiy; Graybiel, et al.). This property is readily detectable if before and after adaptration one uses a test stimulus which differs more or less sharply in its parameters from the training stimulus. In these the teastion to the test stimulus is appreciably less weakened than to to any new labyrinthal stimulus is relatively independent of the preceding training.

"The Diffraction of Waves on Finite Bodies of Revolution"

Kiev, Prikladnaya Mekhanika, Vol 9, No 7, Jul 73, pp 10-18

Abstract: An approximate method is proposed for solving linear problems of the steady diffraction of waves of varied physical nature (elastic, viscoelastic, thermoelastic, thermoelastic, and acoustic) on an arbitrary smooth body of revolution. This method is based upon a variant of the method of "perturbation of the boundary shape," proposed earlier by the author. It is assumed that the shape of the body differs little from sphericity. In each of the approximations, the problems are reduced to problems of diffraction in a spherical system of coordinates, the right-hand members of the boundary conditions changing in each approximation, with identical homogeneous wave equations for all approximations. 1 figure. 25 references.

"Concerning the Solution of Problems for a Circular Cylindrical Shell on an Elastic Base When the Shell is Weakened by Circular Holes"

Kiev, Prikladnaya Mekhanika, Vol 8, No 4, Apr 72, pp 112-115

Abstract: A method previously proposed by A. N. Guz' for solving problems of stress concentration around circular and curvilinear openings of moderate sizes in thin elastic shells weakened by a finite number of holes is used in conjunction with a method of perturbation theory -- representation of the solution in the form of a series in powers of a small parameter -to study the stressed state in a cylindrical shell on an elastic base in the case where the shell is weakened by a finite number of circular openings of different diameters. In each of the approximations, the problem reduces to an infinite system of linear algebraic equations. In the first four approximations, quasiregularity and uniqueness of the solution of these systems is proved with certain assumptions concerning the load applied to the edges of the openings. The method is illustrated by an example of a thin cylindrical shell weakened by two equal circular holes loaded by constant external pressure. One figure, one table, bibliography of ten titles. 1/1

"On the Theory of Wave Propagation in an Elastic Isotropic Body With Initial Deformations"

Kiev, Prikladnaya Mekhanika, Vol 6, No 12, Dec 1970, pp 42-49

Abstract: The influence of initial deformations upon the propagation velocity of elastic waves in an isotropic body is studied within the framework of the theory of finite initial deformations and several variants of the theory of small initial deformations in terms of Lagrange coordinates, with the use of Green's deformation tensor. Proof is given of the conditions that must be satisfied by the form of the elastic potential in order to explain the experimentally obtained rules. Research results for organic glass are presented. The values of second-and third-order elastic constants for organic glass are computed. 2 figures, 1/1 15 bibliographic entries.

"The Propagation and Diffraction of Waves in Bodies With Noncircular Cylindrical Boundaries"

Kiev, Prikladnaya Mekhanika, Vol 9, No 9, 1973, pp 3-11

Abstract: There is set forth an approximate method for solving linear problems of the propagation and diffraction of waves of various physical types in todies with noncircular cylindrical boundaries. The method is based upon a variant of the method of "disturbance of the boundary shape," proposed earlier by the author.

This method permits the construction of approximate solutions of linear problems (four approximations are taken into account) of the steady diffraction and propagation of waves of varied physical nature in bodies bounded by noncircular cylindrical surfaces. In each of the approximations, the problems are reduced to the corresponding problems in a circular cylindrical system of coordinates with homogeneous equations, equal for all the approximations, with changing right-hand sides of the boundary conditions in each of the approximations. The results are obtained in general form for all linear problems of the mechanics of a continuous medium. 26 references.

"The Supporting Capacity of Spherical Shells With a Circular Reinforced Aperture"

Problemy Prochnosti, No 4, April 1970, pp 59-63

Abstract: The article deals with determination of the supporting capacity of a spherical shell in the zone of stress concentration which, as a rule is the starting point of destruction. The shell is loaded by an internal pressure P. By supporting capacity is meant the value of the pressure at which the structure attains a limit state corresponding to the start of destruction. It was found that in verification calculations of such shell structures and in determination of the strongth-reserve coefficient, satisfactory agreement with experimental results may be obtained when the strength criterion is used in accordance with the theory of shape-alteration energy. Deformation strength theories yield greater scattering, even within the limits of a narrow range of destructive pressures. In determining the supporting capacity of the structures, the best coincidence with experimental results are obtained in the case of deformation strength theory. The introduction of ultimate deformation intensity as a strength critorior in such a case yields results which practically coincide with results obtained on the basis of the theory of maximum lanear deformations. 1/1

"A Method of Solving the First Boundary Value Problem for a Hyperbolic Equation with Variable Coefficients" (presented by Academician I. Z. Shtokale, Ukrainian Academy of Sciences)

Kiev, Dopovidi Akademii Nauk Ukrains'koi RSR: Seriya A - Pinyko-Tekhnic'ni ta Matematychni Nauky; June, 1972; pp 497-501

ABSTRACT: The solution of the first boundary value problem for a linear hyperbolic equation with variable coefficients is sought in the form of the sum of the solutions of two problems. Introduction of the differential in-

variant  $h(x) = \frac{1}{4} \left[ \frac{b^{\mu}(x)}{b(x)} \right] - \frac{5}{15} \left[ \frac{b^{\mu}(x)}{b(x)} \right]^{2}$  into the consideration allows one to

find the solution to one of the problems in explicit form. For the solution of the second problem an integral equation solved by a method of successive approximations is obtained.

"Method of Charge Pelletizing"

USSR Author's Certificate No 267913, Filed 28/03/68, Published 24/07/70 (Translated from Referativnyy Zhurnal-Metallurgiya, No 2, 1971, Abstract No 2 G163 P)

Translation: A method of charge pelletizing by moistening, mixing with a binder, forming, and drying is presented. To produce pellets with high porosity, the initial charge is moisturized to 18-30%, and drying is performed at 170-200°.

"Interaction of Elastic Waves with the Boundary in a Bicrystal"

VII Vses. Konf. po Polyarizats.-optich. Metodu Issled. Napryazh., 1971, T. 3 [VII S11-Union Conference on Polarization-optical Method of Studying Stresses, 1971, Vol 3 -- Collection of Works], Tallin, 1971, pp 171-172, (Translated from Referativnyy Zhurnal, Mekhanika, No 4, 1972, Abstract No 4 V135 by Kh. K. Aben).

Translation: The method of dynamic photoelasticity, in combination with selective etching, is used to study the distribution of dynamic stresses in the zone of a boundary in materials with crystalline structure. Studies were performed on flat specimens of bicrystals of lithium fluoride having low-angle (less than 5°) and broad-angle (over 10°) disorientation. A photoelastic coating 0.1 mm thick was applied to one face of the crystal. The stress wave was excited by a micro-explosion of lead azide and sent through a waveguide to the end of the specimen. A cinegram of the interaction of the stress wave with the boundary, produced at 720,000 frames per second, is presented. The study performed shows that a great portion of the energy is reflected from the boundary, while significantly less passes through to the second crystallite.
